GOVERNMENT OF GOA

A REPORT
ON
AGRICULTURAL INPUT SURVEY
2011-12

DIRECTORATE OF PLANNING, STATISTICS & EVALUATION

PANDIT DEENDAYAL UPADHYAY BHAVAN,

PUNDALIK NAGAR, PORVORIM – GOA.

PREFACE

The Directorate of Planning, Statistics & Evaluation has undertaken the Agricultural Input survey with the reference year 2011-2012 as a part of all India Programme of quinquennial Agriculture Census organized by Ministry of Agriculture, Government of India.

The results of the Agricultural Input Survey 2011-2012 in the State is presented in this Report. Concepts, definitions and methodology evolved by the Ministry of Agriculture, Government of India have been adopted.

I am grateful to all the officers and staff who have rendered their efforts in conducting the Input survey and to all who were closely associated with the preparation of this Report. I also place on record my appreciation to National Institute of Electronics and Information Technology(NIELIT), Jadavpur University Campus, Kolkata, for their involvement in processing of data from data entry to final tabulation/ generation of tables.

I hope that this Report will serve as an important and useful official document for Planners, Policy-makers and Researchers in the field of Agriculture.

Anand Sherkhane IES
Director, DPSE &
Dy. Agricultural Census
Commissioner

Porvorim – Goa
Dated : October, 2015

Table 9(A)	:	Estimated number of holders who used certified seeds (Blue Tag) etc. for agricultural purposes	381-382
Table 9(B)	:	Crop-wise distribution of operational holdings used notified seed (certified).	383
Table 9(D)	:	Number of operational holdings by usual methods of soil test and pest control and area covered under soil test.	384
Table 10	:	Estimated number of operational holders by education status.	385
Table 11	:	Average age of operational holders (years).	386
Table 12	:	Average size of household of operational holders (in numbers).	387

A REPORT ON AGRICULTURAL INPUT SURVEY 2011-2012 OF GOASTATE

INTRODUCTION:

Agricultural Input Survey is followed by the main Agricultural Census as a second phase. Agriculture holds a key position and constitutes a predominant sector of the of economy of Goa. The relevant information for micro level agricultural planning is gathered through the first phase of Agricultural Census. The latest information in this series is gathered through Agriculture Census 2010 – 2011 on operational holdings' basis. An "Operational Holding" for the purpose of Agricultural Census is defined as "all land which is used wholly or partly for agricultural production and operated directly or managed as one technical unit by one person alone or with others without regards to the title, legal form, size or location. A holding may consist of one or more parcels of land provided they are within the same Talukas and form part of the same management and has the same means of production such as labour force, machinery and animals".

In the second phase of the Agriculture Census 2010-11, Input Survey with reference year 2011-12, has been conducted in this State for collection of various information on the use of major inputs by man-power like seed, fertilizer, manure and pesticide, irrigation, livestock, agricultural machinery and implements available by enquiring with selected operational holders in sample villages.

PHYSICAL FEATURES, RAINFALL, TEMPERATURE, CROP-SEASON AND POPULATION CHARACTERISTICS:

The State of Goa is situated between the parallels 15^0 – 47' – 59" and 14^0 – 53' – 57" of latitude north and between meridians 73^0 – 40' – 54" and 74^0 – 20' – 11" of longitudes east of Greenwich. Its length from the extreme south to north measures 105 kms. and the width from east to west measures 60 kms. It covers an area of 3,702 sq. kms.

Goa attained statehood on 30th May, 1987. It is located on the West Coast of the Indian Peninsula and between the coastal borders of the States of Maharashtra and Karnataka. It constitutes two Districts, North Goa and South Goa.

The boundaries of Goa are well defined in the north by the Tiracol River, in the east by hilly terrain of southern ends of Sahyadris which separates the State from Maharashtra State and Karnataka State in the south while in the west it is bounded by the Arabian Sea.

The State of Goa has a hilly terrain especially on its eastern side, where lies the southern end of the Sahyadri ranges. The terrain is interspersed by a number of rivers flowing westwards, which provide a network of internal waterways.

The physiographic characteristics are rich and varied consisting of verdant hills, forests, coconut groves and paddy fields. The most picturesque region is located in the lower basins of the rivers Mandovi and Zuari, which join to form a bay. There are about half a dozen inlets between the estuaries of these two rivers, the largest of which is Goa from which the State appears to have derived its name. The climatic topography, geology and vegetation have played a prominent role in the development of the soils in the State. The soils in general are lateritic. The agricultural low lands, especially in the coastal track are alluvial flats formed through sedimentation along the principal rivers. In many cases, they are protected by dykes.

Rainfall and temperature

In Goa, the climate is warm and humid. From June to September, heavy rainfall is received from the Southwest monsoons. There is much variation in temperature over the year. In the western half, where most of the land is below 100 meters in altitude, the rainfall average varies between 2,600 and 4,000 millimetres and the year round temperature varies from 18^0 C to 34^0 C. In the eastern half, where the hills and mountains rise to higher altitudes (max. 1,666 mts. above sea level), temperature variations are wider and the rainfall is considerably heavier.

Crop seasons

In the State of Goa, basically, the soil and climatic conditions are favourable for the growth of a wide variety of tropical crops. Crops like paddy, ragi, pulses, beans, other millets and vegetables are grown during the Kharif season (from May to August). The important crops which are grown during Rabi season (December to February) are paddy, pulses, beans and vegetables. Coconut and arecanut are important among the cash crops. The common fruit bearing trees are cashew, mango, jackfruit, breadfruit, papaya, lemon, banana and pineapple. During the summer season, vegetables such as brinjal, ladies finger, radish, cucumber, pumpkin, drumsticks, different varieties of gourd etc. are widely grown. Sweet potatoes, onions and chilies are grown wherever irrigation facilities are available. Sugarcane is another crop introduced on a large scale due to establishment of a sugar factory in the taluka of Dharbandora in South Goa District.

Population characteristics

As per the 2011 Population Census, the population of Goa was 14, 58,545. The male population was recorded as 7,39,140 while that of females was 7,19,405. The most populous town in the State is Mormugao with a population of 94,393and Shiroda is the highest populated village with a population of 14,041.

OBJECTIVES:

The main objective of the Input Survey is to generate data on consumption of various agricultural inputs, according to major size groups of operational holdings, viz. marginal (below 1.0Ha.), small (1.0-1.99Ha.), semi-medium (2-3.99 Ha.), medium (4-9.99Ha.) and large (10 Ha.and above), for gaining an insight into the consumption pattern of inputs, by various categories of farmers' points. This information is vital for planning their production, imports and distribution of fertilizers. The inputs covered in the survey include chemical fertilizers, 'High Yielding Variety' (HYV) seeds, pesticides, farmyard manure/compost, bio fertilizers, agricultural implements and machinery, livestock and agricultural credit.

REFERENCE PERIOD:

The reference period for the Input Survey as recommended by the Ministry of Agriculture was 2011-12 (July 2011 to June 2012) though for the 'Main Census' the reference period was 2010-11(July 2010 to June 2011). The past practice of Input Survey has been to collect the data separately for kharif and Rabi season. This was recommended to reduce the memory recall lapse. However, since this survey was delayed, it was recommended that the information for both kharif, 2010-11 and Rabi 2010-11 be collected in one go.

ITEMS COVERAGE IN THE SURVEY:

The following information was collected according to size classes of operational holdings in Input Survey 2011-2012.

1. Number of parcels;
2. Multiple cropping separately for irrigated and unirrigated areas;
3. Use of chemical fertilizers, organic manures and pesticides, separately for irrigated and unirrigated areas under crops.
4. Livestock held (numbers), i.e. number of cattle and buffaloes;
5. Use of agricultural equipment and machines;
6. Agricultural credit availed.
7. Types of seeds used and quality problems.
8. Integrated Pest Management (IPM) practices.
9. Age, size of household, educational qualification of holders.
10. Soil health/Soil testing.

METHODOLOGY:

During the 'Main Census', 50% of the villages were selected by using simple random sampling method and in each selected village/ward cent percent of the operational holdings were covered.

Since, the Input Survey 2011-2012 was restricted only to the rural areas, 7% villages were selected randomly in Goa, as a stratum from the villages selected for the Agricultural Census 2010-2011. The number of villages thus selected in the State were 29 as under:

	Tiswadi
1	Jua
2	Renovadi
3	Neura-O-Grande
	Bardez
4	Revora
5	Nadora
6	Marra
	Pernem
7	Morjim
8	Querim
	Bicholim
9	Naroa
10	Latambarcem

	Sattari
11	Codal
12	Saleli
13	Pissurlem
14	Podocem
15	Damocem
	Ponda
16	Vagurme
17	Priol
	Salcete
18	Raia
19	Camurlim
20	Davorlim
21	Utorda

	Mormugao
22	Pale
	Quepem
23	Fatorpa
24	Naquerim
25	Zanodem
	Sanguem
26	Vichudrem
27	Verlim
	Canacona
28	Cola
	Dharbandora
29	Piliem

In each selected village, the operational holdings were grouped into the following size classes.

Sl.No.	Size Classes	Codes
1	Below 1 Ha.(one Ha. is equal to 10,000 sq.mts)	1
2	1 to 1.99 Ha. (1 Ha.and above but below 2 Ha.)	2
3	2 to 3.99 Ha. (2 Ha.and above but below 4 Ha.)	3
4	4 to 9.99 Ha. (4 Ha.and above but below 10 Ha.)	4
5	10 Ha.and above	5

CONCEPTS AND DEFINITIONS

1. OPERATIONAL HOLDINGS:

(i) The data has been collected in respect of each of the "operational holding" which is defined as "*all Land which is used wholly or partly for agricultural production and is operated as one technical unit by one person alone or with others, without regard to the title, legal form of size or location'. The technical unit has been defined as 'that unit which is under the same management and has the same means of production such as labour force, machinery and animals'*. It can be derived from this definition that the actual cultivator and not only the owner is the unit for collection of data.

(ii) An operational holdingwill include both cultivated and uncultivated area. For example, an operational holding consisting of four survey numbers out of which, one survey number is put to non-agricultural use; the total area of the operational holding will be equal to the total geographical area of the four survey numbers. The holding will exclude Government forest land, grazing land etc.

2. PARCEL:

A parcel is all land entirely surrounded by land of other holdings or by land not forming part of any holding. It may consist of one or more cadastral units, plots of fields.

3. HOLDER OR OPERATOR:

The holder/operator is the person who has the responsibility for the operation of the agricultural holding. He exercises the technical initiative and may have full economic responsibility (i.e. as owner)for it or share this with others (as a tenant). When two or more persons share jointly (as partners) in the economic and technical responsibility for the operation of an agricultural holding, each is to be considered as the holder if they belong to different households and the holding will be termed as joint holding.For Input Survey, any one of these could be taken as the operational holder and be approached for responding to the questionnaire.

4. TOTAL AREA OF HOLDINGS:

The total area of the holding should include the total of all land forming part of a unit, which is under the same technical responsibility and management. It should also comprise the land occupied by the farm buildings, including the house of the holder, provided such buildings are within the cultivated area. If the farm buildings are located outside the cultivated area and are covered under Abadi Area, such buildings will not be included in the area of the holding.

5. AGRICULTURAL PRODUCTION:

For the purpose of Input Survey, Agricultural Production would mean the growing of field crops, fruits, nut seeds, trees' nurseries (except those of forest trees), bulbs, vegetables and flowers, production of coffee, tea, cocoa, rubber, jute, oilseeds, fodder, grasses etc.

6. LAND UTILIZATION:

Land Utilization relates to knowing the cropping intensity under irrigated and un-irrigated conditions as such, for the purpose of input survey land under net sown area is considered.

(i) **Net area sown:** It represents the total cultivated area during the reference year without any regard to the number of times it has been cultivated in a year. Thus, for the net sown area, the areas cultivated more than once during the same year is counted only once. Both field crops and orchards forms part of the net sown area.

Apart from net sown area other folds of land are:-

(ii) Area under current fallow- This includes all the areas which are usually cropped but have not been cultivated during the reference year.
(iii) Fallow land other than current fallow.
(iv) Culturable waste.
(v) Permanent pastures and other grazing land.
(vi) Land under miscellaneous tree crops.
(vii) Forest.

7. INTEGRATED PEST MANAGEMENT (IPM)

Integrated Pest Management is categorized in four groups such as agronomic and cultural control, mechanical control, biological control and chemical control. IPM is the judicious combination of the above mentioned approaches.

(i) Agronomic and cultural practices: This is a preventive method and it is based upon knowledge of life history and habits of pests. It includes deep ploughing after harvesting a crop to expose the hidden or resting insects, weeding, removing and destroying of stubbles and other trash, adjusting the time sowing to avoid peak incidence period of pests etc.

(ii) Physical and mechanical control: This is one of the oldest method and includes measures such as collection of eggs and caterpillars (in active stages of pests);

removal and destruction of infested part of the plant, beating of drums, laying of night traps and yellow traps. These methods are found effective in the initial stages of the pest incidence when practiced by a large number of farmers in particular areas.

(iii) **Biological control**: Most of the crops have their natural enemies in the form of parasites and predators and disease causing organisms. These methods are often applied by specialized agencies in conjunction with chemical methods so that harmful effects of insecticides do not interfere with the activities of nature based enemies of pests.

(iv) **Chemical control**: This method relates to use of insecticides, pesticides and weedicides, in the form of dust, sprays and granules on the crops.

8. FERTILIZERS:

(i) **Chemical fertilizers, organic manure, green manure and bio-fertilizers:** A package of practices are followed for replenishing the loss of nutrients from the soil as a result of cultivation to maintain the fertility of the soil and it involves use of organic manure, green manure, chemical fertilizers and bio-fertilizers.

(ii) **Chemical Fertilizers:** Chemical fertilizers refer to chemical compounds, which are manufactured in the factories and are used as soil nutrients. These are classified as "Macro-nutrient" fertilizers which supply Nitrogen (N) Phosphate (P) and Potash (K) and "Micro-nutrient" fertilizers which supply zinc, manganese, copper, iron, and aluminum etc. The popular macro-nutrient fertilizers are – urea, DAP, MOP, CAN and a number of complex fertilizers and their physical mixtures.

(iii) **Organic manures:** Organic manure is usually not manufactured in a chemical factory and is produced by the farmers in their fields using various types of agricultural waste.

(iv) **Bio-fertilizers:** Bio-fertilizers require storage at specified temperatures. These carry some living bacteria on an organic base. Bio-fertilizers are rhizobium, azabactor, blue-green algae and phosphate solubilizingbacteria (PSB). When bio-fertilizers are put into the soil, they start their activities e.g. fixing the nitrogen from air to soil.

(v) **Green manure:** Green manure refers to the cultivation of specific type of vegetation with the intension of ploughing it back in the soil when the leaves are tender and easily decomposable. The popular type of green manures used by the farmers include sesbania (dhencha), sunhemp (sanai), indigo, urd and cowpea.

9. SOIL HEALTH

For assessing the soil health status, the State Government has established testing laboratories for testing the PH value, i.e. N (Nitrogen), P (Phosphorus) and K (Potash) values of the soil samples collected from the farmers' fields. Farmers are accordingly, advised by Testing Labs to increase the fertility of the soil by using specific fertilizers and chemicals depending upon the PH values.

10. CROPWISE AREA (IRRIGATED AND UNIRRIGATED)

Crops are basically classified as food crops and non-food corps as under:

1. **FOOD CROPS:** Food crops include cereals, pulses, spices and condiments, fruits, vegetables and other food crops which are enumerated below:

   (i) **Cereals:** Cereals include rice, jowar, bajra, maize, ragi, wheat, small millets, barley and other cereals.
   (ii) **Pulses:** Pulses includegram, tur, urad, moong, masur etc. and other pulses.
   (iii) **Food-grains:** The total area under cereals plus total area under pulses gives the total area under food-grains.
   (iv) **Spices and condiments:** Spices and condiments includeblack pepper chilies, ginger, turmeric, cardamoms, betelnuts (arecanuts), garlic, coriander and others.
   (v) **Fruits:** Fruits includemangoes, citrus fruits, bananas, apples, guavas, grapes, dry fruits such ascashew-nut and others.
   (vi) **Vegetables:** Vegetablesincludepotato, carrot, sweet potato, tomato, spinach, brinjal, cauliflower etc.

2. **NON-FOOD CROPS:** These include oilseeds, fibres, dyes and tanning material, drugs and narcotics, plantation crops, fodder crops, green manure crops, medicinal plants, floriculture crops and other non-food crops.

   i. **Oilseeds:** Oilseeds include groundnut, caster seed, sesame, rapeseed, and mustard, linseed, coconut, niger-seed, safflower seed, cotton seed and other oilseeds.
   ii. **Fibres:** Fibres include cotton(lint), cotton(kapas), Jute mesta, sun-hemp.
   iii. **Plantation crops:** Plantation crops include rubber, tea and others.
   iv. **Fodder crops:**Fodder crops include guar, oats and other fodder crops.
   v. **Dyes and tanning material:**These include indigo and others.

Analysis of Census Results

- The total number of operational holdings in the State during the year 2010-2011 were recorded as 77,895 with an area of 86,959 Ha of land. The total holdings consisted of 94,695 parcels of which 91524 (96.7%) parcels were located within the village of residence and the rest 3171(3.3%) outside the village of residence but within the district. The average number of parcels per holding was estimated at 1.22, while the average area per parcel and per holding was estimated at 0.92 Ha and 1.12 Ha respectively, as can be seen in **Table 1**.

- It is observed in **Table 2A** that the total irrigated area is cropped only once during the reference period. Thus the net and gross irrigated area cropped remains the same at 34,685 Ha only for all the size groups of holdings, while **Table 2B** shows that the unirrigated area which is cropped once is found to be 49,544 Ha and more than once is 969 Ha for all size group holdings. The area irrigated and unirrigated accounted for 39.9% and 58.1% of the total operated area whereas the current fallow and other uncultivated land was around 2%.

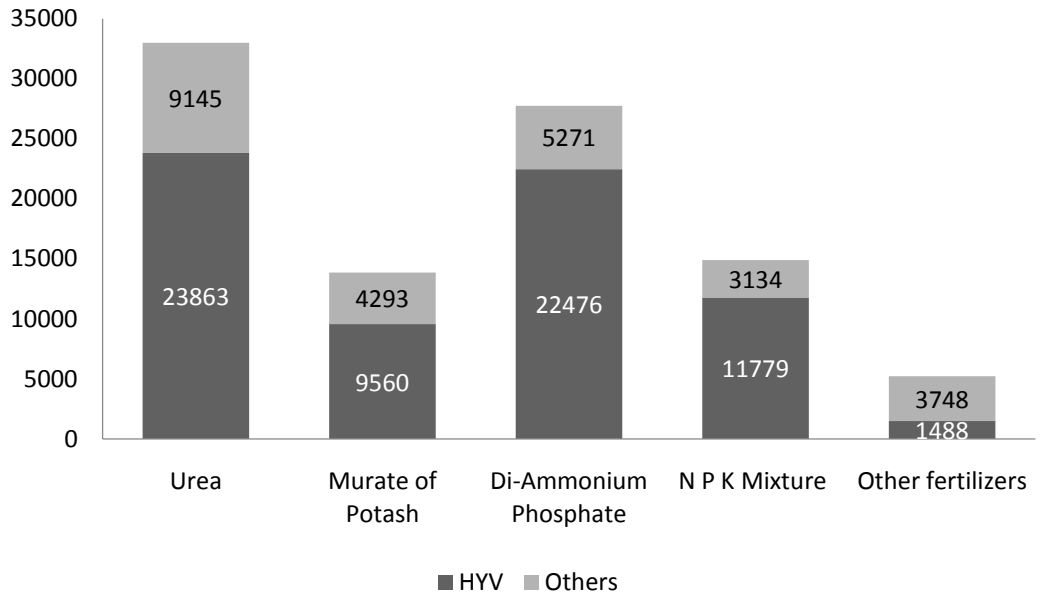

- During the year 2011-12, all the 77,895 holdings in the State comprised of 38,678 irrigated and 77,057 unirrigated holdings of which 24,491 irrigated and 71,519 unirrigated holdings were treated with one or more chemical fertilizers *(Note: irrigated + unirrigated may be equal or greater than total holdings).* The irrigated holdings were distributed in 34,687 Ha of land of which High Yielding Variety (HYV) crops were located in 8,927 Ha while other crops were found to be grown in 25,760 Ha of land. As far as unirrigated holdings are concerned, 20,033 Ha of area was under HYV crops and 31,450 Ha were under other crops. The area under all crops treated with one or more chemical fertilizers was 6,817 Ha and 17,822 Ha respectively being irrigated and unirrigated area under HYV crops, while area under other crops treated with one or more chemical fertilizers was recorded at 7,010 Ha under irrigated and 5,229 Ha under unirrigated land.

- The total quantity of nutrients applied to HYV crops standing under irrigated or unirrigated area was 1,752 MT of nitrogen, 1,498 MT of phosphate and 1,415 MT of potash. The percentage of these irrigated and unirrigated crops was40% and 60% for nitrogen, 42% and 58% for phosphate and 49% and 51% for potash respectively. The distribution of nutrients applied to other crops grown in irrigated area was 394 MT ofnitrogen, 202 MT of phosphate and 235 MT of potash while in un-irrigated areas 631 MT of nitrogen, 152 MT of phosphate and 247 MT of potash was provided by the cultivators to their crops. The details of nutrients applied by different size groups are depicted in **Table 3.**

- The kind of fertilizers mostly used by the operational holders for raising their crops were urea, murate of potash, di-ammonium phosphate (18:46:0) and NPK mixtures along with other fertilizers. The application of these fertilizers to all the crops grown under HYV and other crops whether irrigated or unirrigated for different size groups of holdings can be seen in **Table 3A**.

Area under all crops treated with fertilizers (Area in Ha.)

In particular, 3,955 MT of urea was used for crops irrigated and un-irrigated and for an area of 33,008 Ha under HYV and other crops by all size groups of operational holdings. Similarly, doses of 2,235 MT. of murate of potash, 2,628 MT of di-ammonium phosphate (18:46:0) and 2172 MT of NPK mixtures were given to an area of 13,853 Ha, 27,747 Ha and 14913 Ha of land respectively whether irrigated or unirrigated by all the size groups of operational holdings, So also a variety of fertilizers in lesser quantity of each amounting to 1346 MT was applied in an area of 5236 Ha.

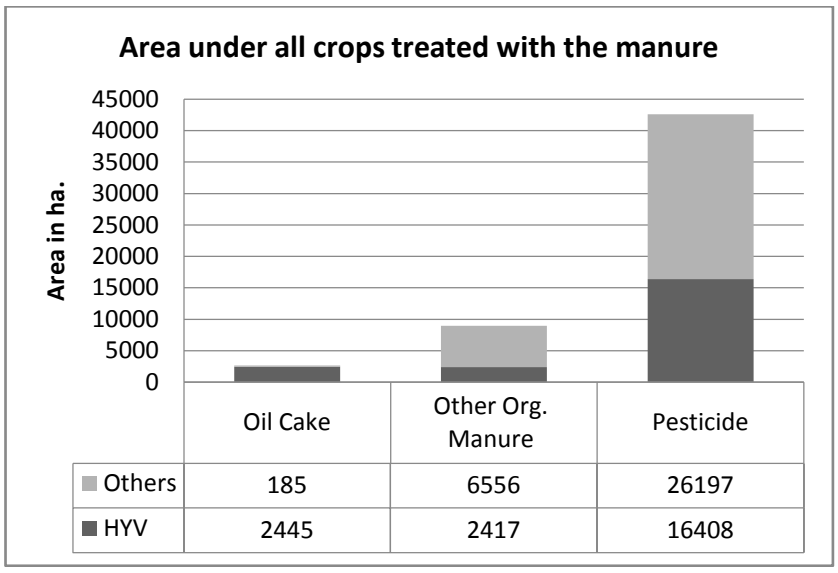

- Application of chemical fertilizers to Food Crops and Non-Food Crops was of the order of 5,619 MT and 906 MT respectively of which composition of N, P and K was 41%, 31% and 28% for food crops and 54%, 10% and 36% for non-food crops respectively covering both HYV (78%) and others (22%) under food cropsand HYV (28%) and others (72%) under non-food crops. Interested researchers may refer **Tables 4 and 4A** for details of distribution of application of fertilizers by each size group holdings whether irrigated or unirrigated, as also applied nutrient quantity under HYV and other crops for different size groups of holdings.

- During this Input Survey,11,190 holdings were recorded treating crops with FYM/compost/biogas manure etc. Out of these,7,219 holdings were irrigated and 3,971were unirrigated.

  The area under these 11,190 holdings was 8,318 Ha and applied 11,156 MT of manure in total. The area under HYV and other crops was 4,311 Ha and 4,007 Ha respectively that received manure to the tune 2,883 MT and 8,273 MT whether the land was irrigated or unirrigated.

  The details of size group-wise holdings and area treated with FYM/compost/biogas manure and quantity are shown in **Table 5A.**

- **Tables 5B, 5C** and **5D** gives information about estimated area under all crops treated with oil cakes, other organic manures and pesticides by size groups, number of holdings using them and the crops HYV or others for which it is used. It is observed that 3,971 holdings used oil cakes and 11,404 holdings treated crops with other organic manure. Farmers with 72,971 holdings with an area of 42,605 Ha also treated their crops with pesticides for protection from pests. Out of these,11,313 Ha of land was irrigated and 31,292 Ha unirrigated, having 16,408 Ha of land under HYV and 26,197 Ha under other crops.

Area under food crops and non-food crops accounted for 6,021Ha and 2,298 Ha respectively and applied either FYM, compost or bio-gas manure to the tune of 8,582 MT and 2,574 MT respectively. The percentage of this manure for HYV and other crops was 32% and 68% under food crops and 6% and 94% for non-food crops with the area under the crop estimated at68% and 32% for food crops and 8% and 92% for non-food crops whether irrigated or unirrigated for all size group of holdings, as may be visualized in **Table 5E**.

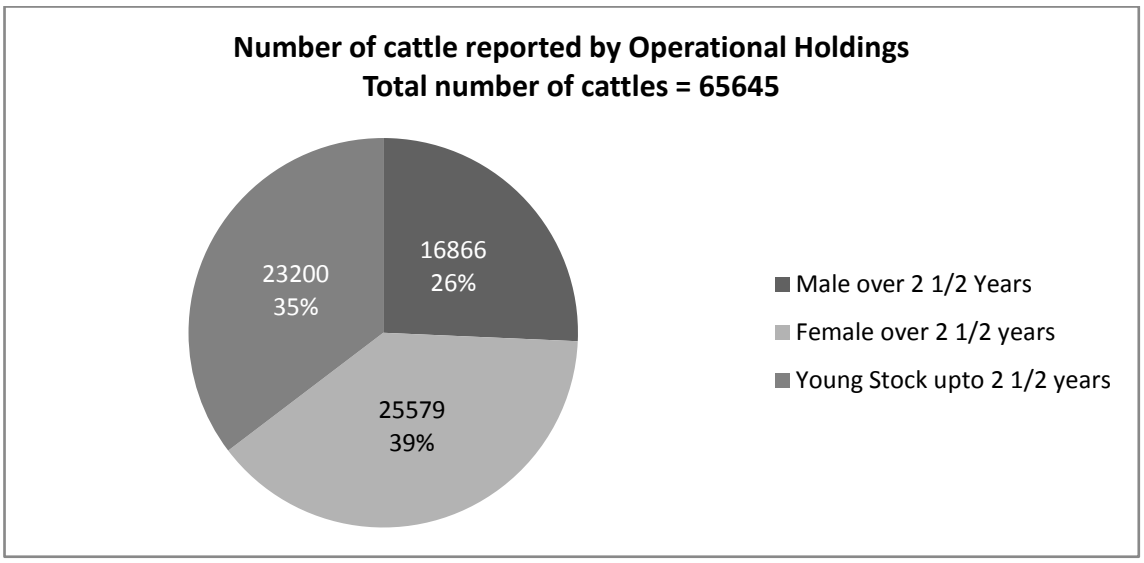

- **Tables 5F to 5L and 5LA** represent distribution of estimated area under different crops treated with oil cakes, other organic manure, pesticides, rhizobium, azetobactor, blue green algae, phosphate solubilizingbacteria (PSB) and green manure respectively by size group of holdings, number of holdings in each category of HYV or other crops whether irrigated or not and the manure applied during the period of reference of survey.

  It is observed that pesticides is used in the highest number of the operational holdings. The area treated with pesticides under the food crops for HYV and others was 16,408 Haand 24,759 Ha respectively and non-foodcrops showed 0 and 1,437 Ha under HYV and others category. It is also observed that Rhizobium, Blue Green Algae, Azetobactor and PSB were not used in even a single operational holding, however green manure was treated in food and non-food crops.

- **Tables 5M, 5N, 5O, 5P, and 5PA** exhibit information as regards estimated area under all crops treated with rhizobium, azetobactor, blue green algae, phosphate solubilizingbacteria(PSB) and green manure as also number of holdings under each category by size groups of holdings.

- The information with regard to number of cattle/buffalo reared by operational holders, by type of, agricultural machinery used, credit obtained from institutions for agricultural purpose, use of certified/notified seeds by operational holders and method of soil tests and pest control and area covered under soil test by size groups of holdings can be seen in **Tables 6A to 9D**.

- During the survey period, male cattle were reported at 16,866of which 16,118were working animals and 748were others. Female cattle numbered 25,579 comprising14,589 milch animals and10,990 others as reported by 9,743 and 10,949 holdings respectively. As also, another 7,879 male and 15,321 female young stock up-to the age of 2½ years were reported by 9,257 holdings. The total number of cattle was 65,645(**Table 6A).**

- Total number of buffalos recorded were 26,355 of which 8,949 were male (8,410 working animals and 539 others), 10,232 females (7,855 milch and 2,377 others) while young stock up-to 2 ½ years were 2,384 males and 4,790 females **(Table 6B).**

- A variety of agricultural implements/equipments were used during the survey, whether hand operated, animal operated or power operated. The Hand Hoe was reported as the highest hand operated implement (29,092 nos.) used by the operational holdings. The least hand operated implement was the Wheel Hoe (878 nos.). Among the animal operated implements, the Wooden Plough was the most commonly used (30,412 nos.) and the least utilized was the Animal Drawn Puddler at 788 nos. 21,948 nos. of power tillers were reported under power operated implements, which was the highest among the power operated implements. More details are given in **Table 7.**

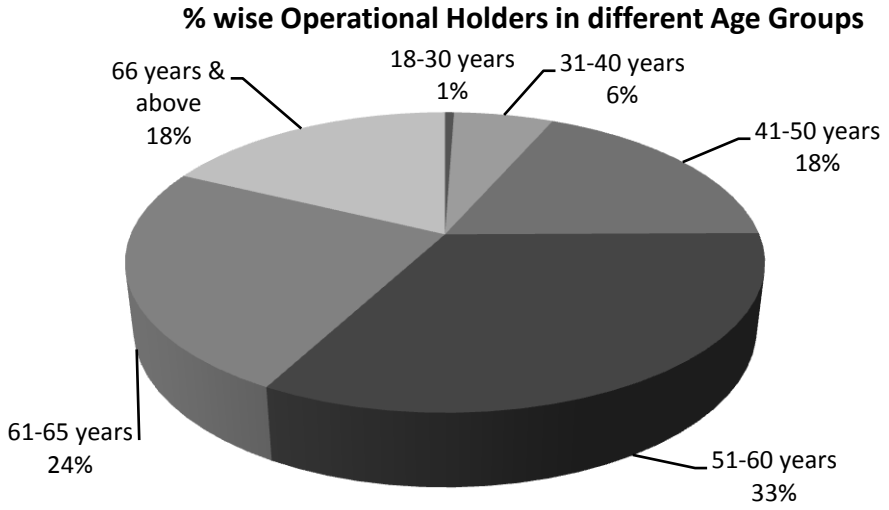

- The total number of operational holdings that availed benefits of institutional credit were reported at 9,677. It is observed that no operational holding availed loan from Primary Land Development Bank/Branch of SLDB. The short term, medium term and long term loan availed has been recorded at 12.92 crore, 2.49 crore and 1.58 crore respectively. The total loan disbursed through Institutional Credit was 16.99 crore. Out of the 12.92 cr. Short term loan Rs.5.10 crore were utilized towards fertilizers, Rs 1.62 crores on other inputs whole Rs.6.20 cr. were availed in cash. (**Table 8)**.

- **Tables9A to 9D** depict information pertaining to the use of certified seeds and pest control in land holdings. Out of 77,895 holdings, 16,623 holdings used certified seeds; notified seeds were used by 16,000 holdings while 614 farmers took foundation programmes in their holdings. 77,178 holdings adopted pest control under various methods while 717 holders did not adopt any method of pest control or soil testing.

- The educational status of operational holders was also recorded during the Survey where 13% were listed as illiterate, 26% up-to Class V, 18% middle school, 33%

secondary school, 6% senior secondary school, 2% technical diploma holders below degree level and 3% were graduate and above. **(Table 10)**

- **Tables 11 and 12**show that the average age of operational holders was 56 years; maximum (33%) of them were found in the age group of 51 to 60 years, as far as size of their household is concerned the average size was 4.45. The majority of households i.e. 53,154 (68%) were found to have maintained their family size to 4 to 6 members.

- It can be observed from the above pie chart that over 75% of operational holders enumerated were above 50 years of age. It is also seen that about 7% of operational holders listed in the age groups of 18-40 years, out of which, the age group 18-30 years contributed just 0.5%, which shows that the youth were involved in activities other than agriculture during the survey.
